Top IT and Cyber Risks to Include in Your Audit Plan

HCCA – Compliance Institute
April 15, 2018

Johan Lidros  CISA, CISM, CGEIT, CRISC, HITRUST CCSFP, ITIL-F
President Eminere Group
**Presenter**

- Johan Lidros, Founder and President of Eminere Group

- Has provided information technology governance and information security services in the healthcare industry for 20 years in Europe and in the United States

- Well-versed in accepted IT and information security standards/frameworks (ISO27000, HITRUST, NIST, COBIT, CIS, etc.) and has participated in several related committees

- Certifications: CISA, CISM, CGEIT, ITIL-F, CRISC, HITRUST CCSFP
Table of Contents

- Introduction
- Key IT and Cyber Risks and Opportunities
- What Risks to Audit?
- Board and Management Communication
- Trending Best Practice/Standards and Resources
- Conclusion
- Q&A
Objectives

- What are the key IT and Cyber risks you need to be aware of?
- What IT and Cyber risks do you need to audit?
- What evolving IT and Cyber risks do you need to discuss with management?
- What IT and Cyber risk training do you need to provide to the audit committee/board?
- What are the most common hidden IT and Cyber opportunities?
- What are the most trending best IT governance/security, best practices and standards?
- Your Questions!!!
IIA 2120 - Risk Management

The internal audit activity must evaluate the effectiveness and contribute to the improvement of risk management processes.

- **Determining whether risk management processes are effective is a judgment resulting from the internal auditor’s assessment that:**
  - Organizational objectives support and align with the organization’s mission;
  - Significant risks are identified and assessed;
  - Appropriate risk responses are selected that align risks with the organization’s risk appetite; and
  - Relevant risk information is captured and communicated in a timely manner across the organization, enabling staff, management, and the board to carry out their responsibilities.
# Table of Contents

- Introduction
- **Key IT and Cyber Risks and Opportunities**
- What Risks to Audit?
- Board and Management Communication
- Trending Best Practice/Standards and Resources
- Conclusion
- Q&A
The use and deployment of information technology (IT) is a critical success factor for most organizations. Designing, implementing, operating, maintaining and monitoring an efficient and effective IT solution is a difficult task. The speed of change, complexity and new requirements in the technology arena impact the risk environment:

- Patient safety
- Patient satisfaction
- Costs
- Security and privacy
- Regulatory compliance
- Operational efficiency
Information Security

Protection of information and information systems from unauthorized access, use, disclosure, disruption, modification, or destruction in order to provide CIA:

- **Confidentiality**: preserving authorized restrictions on access and disclosure, including means for protecting personal privacy and proprietary information; and
- **Integrity**: guarding against improper information modification or destruction, and includes ensuring information nonrepudiation and authenticity;
- **Availability**: ensuring timely and reliable access to and use of information.

Information Security is concerned with information and the protection of information whether be it physical or computerized.
IT and Cyber Security Definitions

Cyber Security

- Collection of tools, policies, security concepts, security safeguards, guidelines, risk management approaches, actions, training, best practices, assurance and technologies that can be used to protect the “cyber” environment and organization and user’s assets [ITU-T X.1205].

- Cyberspace” is defined as “the complex environment resulting from the interaction of people, software and services on the Internet by means of technology devices and networks connected to it, which does not exist in any physical form”.

- **IT Security**

- Protection of information and information systems against unauthorized access or modification of information, whether in storage, processing, or transit, and against denial of service to authorized users. Information security includes those measures necessary to detect, document, and counter such threats. Information security is composed of computer security and communications security [The Free Dictionary].
Health IT - Definition

- The term "health information technology" (health IT) is a broad concept that encompasses an array of technologies to store, share, and analyze health information.

- Definition (Office for the National Coordinator of Health Information Technology)

- “Health IT systems compromise the hardware and software that are used to electronically create, maintain, analyze, store, or receive information to help in the diagnosis, cure, mitigation, treatment, or prevention or disease.”
Key Drivers - Impacting Areas

- Regulatory requirements
- Cloud
- PII/EPHI Theft
- Patient interaction
- Telehealth
- Social media
- Big data Analytics
- Portable devices

Health IT

- Patient Safety
- Data Integrity
- Availability

Information Governance

Information Security

Confidentiality
Healthcare IT Characteristics

- Diversified IT environment
- Medical Devices and IT System coming together
- EMR and HIE are changing the IT environment
- Cloud is getting common
- Many regulatory requirements
- Constantly new and changing threats/risks related to the use of technology
- Immature IT/Information Security
## Shift the IT Perspective:

<table>

Risk Management

- Risk and Value
  - Risk has two faces:
    • Protecting against value destruction
    • Value creation opportunities are not missed!
  - Understanding risk and managing it is key for creating and safeguarding value
The table below lists examples of common IT security risk areas that been identified at healthcare systems.

Risk Management Approach

Identified IT high risk areas (at a gross risk level)

Assess risk management

Risk acceptance – Can management accept the existing risk level?

Gross Risk Map

Risk Management

Net Risk Map

Identified IT high risk areas (at a gross risk level)

Assess risk management

Risk acceptance – Can management accept the existing risk level?

Risk Management Approach
High Reliability Organizations (HRO)

- Patient safety is a long-recognized problem in health care
  - “One-third of hospital admissions have an associated adverse event, a number ten times higher than previously reported. Despite a significant effort by the health care community over the last decade to improve patient safety, there has been no significant improvement overall.“*

High Reliability Organizations (HRO)

Health IT – Where we are heading…

- HRO Characteristics
  - High levels of safety and under inherently risky, technology complex and demanding conditions

- “Healthcare organizations are striving to become HROs such as aviation, nuclear power, and the military”
High Reliability Organizations (HRO)

- Other high-risk industries (aviation, military, and nuclear energy) have made significant improvements in safety despite their complexity.
  - Conscientious efforts to ensure that errors do not lead to harm.
  - “commercial airline pilots and air traffic controllers make approximately two errors for every hour flown, yet U.S. air travel is extremely safe.”
  - Safe System Approach – High Resilience
Patient Safety and Information Technology

“A review of numerous studies indicates that health IT has been a factor from anywhere from 2% to nearly 7% of the total safety events reported.”

May 2017 Report: Patient Safety and Information Technology – Improving Information Technology’s Role in Providing Safer Care

Bipartisan Policy Center

Ransomware attackers collect ransom from Kansas hospital, don't unlock all the data, then demand more money.

In February 2016, the Hollywood Presbyterian Medical Center paid $17,000 to restore access to its system.

University pays $20,000 to ransomware hackers

FBI’s Advice on Ransomware? Just Pay The Ransom.
Unlike denial-of-service attacks which undermine the availability of entire systems or data breaches which steal away confidential data, integrity focused attacks maliciously modify data or transactions.

The growth of *Integrity*-attacks could be the unexpected shift which will fuel significant change in perspectives, expectations, and controls.

Such cyber events will probably be some form of data sabotage, the subtle tweaking of data within transactions to gain some type of benefit.

Banking infrastructure malware Carbanak, which was discovered in 2015, infected banks and selectively modified systems to create a small number of fraudulent transactions which fleeced hundreds of millions of dollars in a single coordinated campaign.

"That's the interesting thing about integrity attacks — they can be highly beneficial to the attacker in that they can often achieve their goals more effectively than a traditional attack," said Steve Grobman, chief technology officer of Intel Security Group

Fraudulent messages crafted from executive’s accounts to account-payable departments, instructing money transfers be made immediately to a 3rd party.
Top 10 Health Technology Risks 2014

- ECRI institute annual report

THE LIST FOR 2014

1. Alarm hazards
2. Infusion pump medication errors
3. CT radiation exposures in pediatric patients
4. Data integrity failures in EMRs and other health IT systems
5. Occupational radiation hazards in hybrid ORs
6. Inadequate reprocessing of endoscopes and surgical instruments
7. Neglecting change management for networked devices and systems
8. Risks to pediatric patients from “adult” technologies
9. Robotic surgery complications due to insufficient training
10. Retained devices and unretrieved fragments
Top 10 Health Technology Risks – ECRI 2014

1. Alarm Hazards
2. Infusion Pump Medication Errors
3. CT Radiation Exposure in Pediatric Patients
4. Data Integrity Failures in EHRs and other Health IT Systems
5. Occupational Radiation Hazards in Hybrid ORs
6. Inadequate Reprocessing of Endoscopes and Surgical Instruments
7. Neglecting Change Management for Networked Devices and Systems
8. Risks to Pediatric Patients from “Adult” Technologies
9. Robotic Surgery Complications due to Insufficient Training
10. Retained Devices and Unretrieved Fragments
Top 10 Patient Safety Concerns 2015

1. Alarm hazards: inadequate alarm configuration, policies and practices*
2. Data integrity: incorrect or missing data in EHRs and other health IT systems
3. Managing patient violence
4. Mix-up of IV lines leading to misadministration of drugs and solutions*
5. Care coordination events related to medication reconciliation
6. Failure to conduct independent double checks independently*
7. Opioid-related events
8. Inadequate reprocessing of endoscopes and surgical instruments
9. Inadequate patient handoffs related to patient transport*
10. Medication errors related to pounds and kilograms*
Top 10 Patient Safety Hazards ECRO 2016

- 1. Health IT Configurations and Organizational Workflow That Do Not Support Each Other
- 2. Patient Identification Errors
- 3. Inadequate Management of Behavioral Health Issues in Non-Behavioral-Health Settings
- 4. Inadequate Cleaning and Disinfection of Flexible Endoscopes
- 5. Inadequate Test-Result Reporting and Follow-up
- 6. Inadequate Monitoring for Respiratory Depression in Patients Prescribed Opioids
- 7. Medication Errors Related to Pounds and Kilograms
- 8. Unintentionally Retained Objects despite Correct Count
- 9. Inadequate Antimicrobial Stewardship
- 10. Failure to Embrace a Culture of Safety
Top 10 Health Safety Hazards 2017

1. Infusion Errors Can Be Deadly If Simple Safety Steps Are Overlooked
2. Inadequate Cleaning of Complex Reusable Instruments Can Lead to Infections
3. Missed Ventilator Alarms Can Lead to Patient Harm
4. Undetected Opioid-Induced Respiratory Depression
5. Infection Risks with Heater-Cooler Devices Used in Cardiothoracic Surgery
6. Software Management Gaps Put Patients, and Patient Data, at Risk
7. Occupational Radiation Hazards in Hybrid ORs
8. Automated Dispensing Cabinet Setup and Use Errors May Cause Medication Mishaps
9. Surgical Stapler Misuse and Malfunctions
10. Device Failures Caused by Cleaning Products and Practices
Top 10 Health Technology Hazards 2018

1. **Ransomware and Other Cybersecurity Threats to Healthcare Delivery Can Endanger Patients**
2. **Endoscope Reprocessing Failures Continue to Expose Patients to Infection Risk**
3. **Mattresses and Covers May Be Infected by Body Fluids and Microbiological Contaminants**
4. **Missed Alarms May Result from Inappropriately Configured Secondary Notification Devices and Systems**
5. **Improper Cleaning May Cause Device Malfunctions, Equipment Failures, and Potential for Patient Injury**
6. **Unholstered Electrosurgical Active Electrodes Can Lead to Patient Burns**
7. **Inadequate Use of Digital Imaging Tools May Lead to Unnecessary Radiation Exposure**
8. **Workarounds Can Negate the Safety Advantages of Bar-Coded Medication Administration Systems**
9. **Flaws in Medical Device Networking Can Lead to Delayed or Inappropriate Care**
10. **Slow Adoption of Safer Enteral Feeding Connectors Leaves Patients at Risk**
Reported Top Safety Issues Health IT - ONC

- System interface issues
- Wrong input
- Software issue – system configuration
- Wrong record retrieved/duplicate records
- Software issue – functionality

Figure 3. ECRI Institute PSO Deep Dive Identifies Top Five Safety Issues from Health IT Events

The percentage identified with each event type represents the accumulative total of that event type and any preceding event types as a portion of the 211 safety events.
Most Common “IT” Issues – Patient Safety

- Approximately 5% of reported patient safety issues in these studies were Health IT related with the conclusion:
  - 75% of these were preventable.

- There were limited numbers of reported incidents related to access issues, network failures, hardware failures, security, malware or virus issues.

Reviewable Sentinel Events

Adverse events

No harm incidents
Near misses
Hazards and risks
Key Aspects – Root Causes

- Limited awareness of the safety risks introduced by Health IT
- Traditional department “silos” between risk management, IT, and quality and safety management
- Urgent need for tools and metrics to manage Health IT safety risks.
General Conclusions:

- Lack of Security Talent
- Legacy Equipment
- Lack of Standards
- Meaningful Use drove unsecured connectivity

- Not an IT issue - PATIENT SAFETY ISSUE
A retrospective, cohort study of claims in the CRICO Strategies national Comparative Benchmarking System was conducted for medical malpractice cases coded using a specific coding taxonomy during the period January 1, 2011 through December 31, 2015.

EHR-related adverse events involve both user- and system-related issues.

<table>
<thead>
<tr>
<th>EHR-related Factors Contributing to Patient Harm</th>

</tr>
</tbody>
</table>

N=420 MPL cases asserted 1/1/11-12/31/15 with an EHR-related factor identified.
System related issues

- PCP cannot access radiology studies during patient visit; results later filed without PCP review.
  - **Result:** delayed diagnosis of lung cancer.

- MD unable to access nursing ED triage note.
  - **Result:** death from mismanaged subarachnoid hemorrhage.

- When the complaint field was too small to record "sudden onset chest pain w/burning epigastric pain," the patient’s complaint was shortened to "epigastric pain."
  - **Result:** mismanaged workup and subsequent cardiac event.
User-related issues (training and education)

- OB could not access patient’s clinic notes documenting abnormal fetal size, citing lack of training and no EHR password.
- MD received an amoxicillin allergy alert but ordered it anyway, causing allergic reaction.
- Patient developed amiodarone toxicity after history and medications copied from previous note did not document patient was already on this medication.

Produced with the help of an Interagency Work Group led by the Agency for Healthcare Research and Quality and submitted on behalf of the Secretary of the Department of Health and Human Services
Table of Contents

- Introduction
- Key IT and Cyber Risks and Opportunities
- What Risks to Audit?
- Board and Management Communication
- Trending Best Practice/Standards and Resources
- Conclusion
- Q&A
What are our IT Audit Challenges?

- Lack of information
- Resources
- Skills
- Reactive instead of pro-active
- Evolving area
Fines Biggest Risk?

- **1. Hollywood, Fla.-based Memorial Healthcare System** agreed to implement a corrective action plan and paid HHS **$5.5 million** to settle claims it violated HIPAA.
  - Unauthorized employee access
  - Terminated employee affiliated organization
  - No regular review

- **2. HHS' Office for Civil Rights** fined Children's Medical Center of Dallas **$3.2 million** for failing to comply with HIPAA on multiple occasions.
  - 2010 unencrypted device
  - 2013 unencrypted device

- **3. MAPFRE Life Insurance Company of Puerto Rico** agreed to implement a corrective action plan and pay **$2.2 million** to HHS' Office for Civil Rights to settle claims it violated HIPAA.
  - Unencrypted device
  - Risk management plan and action
Reported Security Breaches to OCR 2009-2016 per Type

- 480 Unauthorized access/disclosure
- 266 Hacking
- 795 Theft
- 154 Loss
- 63 Improper Disposal
Root Causes

- Lack of Policies in Key Areas, no IT Standards and Limited/Weak Formal Procedures in Key Areas
- Managements and Business/Information owner’s responsibilities for IT Security is Not Well Defined and Communicated
- Risk Management Plan and Risk Analysis Goals/Measurement/Reporting
- Lifecycle Management – Hardware/Software
- Resources in Key Areas e.g. networks, system administrators, disaster recovery, security governance
- Weak Critical Foundational IT Processes
  - Patch management
  - Change management
  - IT Asset Management
  - Disaster recovery
- IT Governance – ERM – Leadership
Change in Security Landscape

- Move from “careless” security breaches (lost of laptops) to a more active Cyber Crime as a business (ransomware/extortion)

- More than 40% of Breaches are due to “unintentional employee negligence” which can be attributed to inconsistent organizational policies, processes not being followed, and uncertainty by staff with different levels of training and experience

  (Source: http://www.hhs.gov/ocr/privacy/hipaa/administrative/breachnotificationrule/)

- Information security risks are now undermining healthcare’s intellectual property, brand, and mission, and threatening patient care and safety in the process.
The board must direct the balance between conformance and performance goals. How about the audit plan?
IT Governance Areas

![Diagram showing the IT Governance areas: Risk Management, Resource Management, Value Delivery, Strategic Alignment, Performance Measurement.]

### Process Maturity Rating

<table>
<thead>

</table>
IT Governance

“you can not manage what you can not measure.”
Roles/Responsibilities

ACCOUNTABILITY

- Accountability applies to those who own the required resources and have the authority to approve the execution and/or accept the outcome of an activity within specific Risk IT processes.

RESPONSIBILITY:

- Responsibility belongs to those who must ensure that the activities are completed successfully.

Legend of the table:

- When a cell is YELLOW, the role carries responsibility and/or partial accountability for the process.
- When a cell is GREEN, the role carries main accountability for the process. Only one role can be the main accountable for a given process.
# Responsibilities & Accountability (RISK-IT)

AHIA – IT Audit and IT Security Survey 2014-17
Most Common Audit Areas

- Identity and Access Management
- EMR Core System
- IT General Controls
- HIPAA
- Financial Systems
- Vendor Management
- Business Continuity and Disaster Recovery
- Network Security
- PCI
- Mobile Device Management
- Patch Management
- Cybersecurity
- New Systems
Additional Key Risks to Audit

- **Health IT**
  - Internet of Things
  - Telehealth
  - Apps (internet of things)
  - Risk Management
  - Medical Devices

- **Data Warehouse**
- **HIE**
- **Information Governance**
- **IT Governance**
- **Patient Communication/Portal**
- **Backup Management**
- **Security Awareness Training**
- **Emergency Management/BCP/DR**
Added Value Audits – Hidden Opportunities

- **Life Cycle Management**
  - Application/Tool functionality
  - Tools
  - Cost
  - Age
  - Utilization
  - Budget/capacity/acquisition processes

- **Identity and Access management**
  - Number of systems
  - Authentication
  - Resources for management of access management (FTE/cost)
IT Audit Plan Considerations

- Comprehensive IT Risk Assessment
- Build Long Term IT Audit Plan
- Regular Audit of Key Control Areas
  - Value added internal benchmarks
  - Trends
- Framework Based
  - Standard benchmark
- Pro-Active Audits/Value Added Work
  - Pre-implementation
  - Committees
- Value – Cost – Investment – i.e. Performance
- Audit Tools

Regular Security Reporting

- **Risk Management Program**
  - Status management program – see example next page – Dash board
  - Number of risk assessments performed – Defined assessments and analysis per IT and organization projects, to include change control.
  - Time to remediate issues – The time between identification and remediation.

- **Vulnerability Management**
  - Issues by Status – When a vulnerability is identified on a system the first time, it is a new data point that should inform and, depending on the situation, drive an action.
  - Remediation Time - Measure the length of time from identification to remediation and is a measure of the efficiency of the patch and remediation cycle.
  - Mean time to Patch – The time between identification of a needed patch and the installation of the required patch.

- **Exceptions**
  - The number of information security policy exceptions requested and granted

- **Incident Management**
  - Number of Events - Events are activities or indicators that warrant further investigation and can be indicators of incidents.
  - Number of Incidents - Incidents occur when a material event or events have occurred and require a formal response activity.

- **Specific Initiatives**
  - CMS Quality Measurements
### CMS Quality Measurements - Examples
